ELECTRONIC AND VIBRATIONAL LEVELS OF THE
CRYSTAL AND MOLECULE OF NAPHTHALENE.
[1960]. 15p. 8 refs. TL968; M2076.
Order from LC or SLA ml\$2.40, ph\$3.30 61-13433

Trans. of [Zhurnal Eksperimental'noy i Teoreticheskoy Fiziki] (USSR) 1949, v. 19, no. 5, p. 383ff.

A detailed comparison of the absorption spectra of the crystal and vapor of naphthalene shows that, in addition to those electronic series which have corresponding members in the vapor, there exist also electronic levels peculiar to the crystal. The spectral transitions to these latter levels from the normal one consist of sharp, polarized, line spectra. Transitions to those lines which correspond to levels of the molecule in the gas do not correlate well with the polarized line spectra of the crystal. The first category of transitions have the symmetry of the crystal, while the second have the symmetry of the molecule. The normal (Chemistry--Physical, TT, v. 5, no. 2) (over)
